Supporting Healthcare Professional Screen Patients

Catalyst™ Offers Standalone Online Patient Intake for COVID-19

April 7, 2020

Alliance Care Technologies' Catalyst™ is an online solution that administers condition/symptom specific questionnaires to the patient prior to the appointment. Data collected includes demographic, medical history, review of body systems, health status, and history of current illness.

Patented work-up algorithms provide physicians with a differential diagnosis as clinical support. Information collected is integrated into the patient's record and ready for coding and billing. Catalyst™ offers over 800 condition questionnaires that are age and gender specific where relevant. Physicians preview the clinical information provided by the patient which is converted into easy to review prose prior to the visit. The patient input can be integrated into the EMR. Physicians can focus on the patient's ailments and reduce the time to diagnosis and treatment.

Medical institutions around the world are increasingly implementing online telehealth tools to efficiently meet the needs of their patients. Alliance Care Technologies team has been creating and refining the use of online condition/symptom specific questionnaires for the past two decades. A COVID-19 condition questionnaire has been added to the Catalyst™ solution. As the disease and knowledge about COVID-19 evolves the questionnaire is continuously updated.

In support of healthcare providers struggling to meet the critical needs of patients and manage strained resources, the COVID-19 solution is being offered as a standalone patient questionnaire.

The COVID-19 online guided patient interview can be plugged into a medical organization's website, appointment request form, or it can be fully integrated into the EHR via the full Catalyst™ solution.

Patients can be directed to the medical center's website or patient portal to complete the questionnaire rather than tying up phone lines. Data collected includes demographic, medical history, review of body systems, health status, and history of current illness. Medical staff can review the output and prioritize patients based on symptoms, chronic conditions and severity of illness in a fraction of the time compared to individual telephone triage. Physicians can utilize the output to prioritize testing decisions.
